                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence was deduced from a clone isolated from a lambda EMBL3 genomic library prepd. from human leukocyte DNA, using a probe synthesised based on the sequence of the known human NGF gene [A. Ullrich et al., Nature 303, 821 (1983)]. The clone, betaLN2113, isolated from the library was cleaved with Smal and Apal to remove a 1kb fragment contg. the gene which was then inserted into plasmid pBluescript IIK to obtain pNGFP107G. The gene was sequenced from this plasmid using Seeknase (Blochemical). The sequence of the protein coding region was found to be in complete agreement with that of Ullrich et al. The sequence was used to produce recombinant h-NGF for use in the prodn. of drugs for e.g. senile

The nerve growth factor (NGF) gene is expressed in Escherichia coli cells. The recombinant protein is solubilized and sulfonylated and allowed to refold in the presence of PEG and urea. Biologically active NGF, used for promoting the survival of and maintaining the phenotypic differentiation of nerve and gilal cells, is isolated and purified. This method breaks incorrectly formed disulphide bonds and allows refolding of the factor into the correct tertiary structure required for maximum yield of full active protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Process for bacterial expression of recombinant neurotrophic factor - useful for promoting the survival and maintaining phenotypic differentiation of nerve and glial cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A novel recombinant vector has been developed which comprises a nucleotide sequence encoding a fusion protein. The fusion protein comprises three domains joined together in order, from N-terminus to C-terminus, of a first domain comprising a protein of interest, a secon domain comprising a hydrophilic spacer and an affinity domain, each domain comprising amino acid residues. The present sequence represents human preproNGF, used in example 6 of the present invention. The recombinant vector is used for the production of authentic recombinant proteins of interest. The method of the invention is useful for the expression of fusion proteins capable of isolation by affinity chromatography in pro- or eukaryotic cells. This method allows for the efficient cleavage and generation of authentic proteins of interest that do not contain extraneous (i.e. non-naturally occurring)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       proteins

This polypeptide comprises the human nerve growth factor (NGF)
CC beta chain precursor. Methods are provided for large-scale
purification of neurotrophins, including mature NGF, suitable for
CC clinical use. A claimed method comprises: (1) separating the
CC neurotrophin from the other proteins using a hydrophobic
CC interaction chromatography resin (HICR); and optionally (2)
CC separating the neurotrophin from a chemical variant by high
CC performance cation exchange chromatography (HPCEC). The processes
CC can also be used for purification of e.g. mouse NGF (see AAW4887),
CC brain-derived neurotrophic factor (see AAW4888), neurotrophin-4/5
CC (see AAW4889)) and neurotrophin-3 (see AAW4888). The processes allow
CC separation of neurotrophins from various undesirable misprocessed,
CC misfolded, size, glycosylated or charge forms. They allow selective
CC separation from their variants and other molecules, and from other
CC separation swith high pI. The processes are applicable to
CC starting materials from various sources, including fermentation
CC broths or lysed bacterial or mammalian cells.
                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to neuronal factor (NF; also known as neuronotrophin-J/NT-3; see AAF55803-AAF55803 and AAB66927-AAB66928). NF is useful in treating neurodegenerative diseases, e.g. Alzheimer's disease, parkinson's disease, Huntington's chorea and other conditions characterised by necrosis or loss of neurons. NF is also useful for treating damaged nerves, e.g. nerves damaged by traumatic conditions such as burns or wounds. The present sequence is human nerve growth factor (NGF), which was used in a sequence homology alignment with human NF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; neuroprotective; neurodegenerative disease; Huntington's chorea; nerve
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          17-APR-2001

                                                                                                                                                        The invention relates to a method for delivering therapeutic neurotrophin to targetted defective, diseased or damaged cholinergic neurons in the mammalian brain. The method comprises delivering a neurotrophic composition comprising a neurotrophin encoding transgene into one or more delivery sites within a region of the brain containing targetted neurons. The method is useful for treating neurodegenerative conditions such as Alzheimer's disease, parkinson's disease, amyotrophic lateral sclerosis (ALS) in primates by stimulating the growth of neurons thus recovering neurological function. The present sequence is human nerve growth factor (NGF-2) protein which is a neurotrophin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human beta nerve

                                                                                                                                                                                                                                                                       atrophy and loss of accompanying normal aging in the mammalian brain. The method comprises delivering a growth factor (GF)-encoding transgene to preselected delivery sites in the brain, so that the encoded GF is expressed in the brain and stimulates axonal growth in targeted GF-receptive neurons. The growth factor has nootropic, neuroprotective and anti-aging activities, and can be used as a cholinergic neuron growth stimulator and in gene therapy. The method is used to ameliorating neuronal atrophy and loss of accompanying normal aging, in the human brain. The present sequence represents human beta nerve growth factor, which is given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ameliorating neuronal atrophy and loss of accompanying normal aging comprises delivering a transgene encoding a growth factor to a mammalian brain to stimulate axon growth in cholinergic neurons -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; nerve growth factor 2; beta nerve growth factor; NGF-2; N

```

The present sequence represents a PTMA-8 (not defined) polypeptide. The sequence is derived from clone A1049825. The polypeptide is 26958.5 daltons. PTMA polynucleotides and polypeptides are used in the manufacture of a medicament for treating a syndrome associated with a human disease, the disease selected from a pathology associated with PTMA. They may be useful in the treatment of various immune deficiencies and disorders. These immune deficiencies may be genetic or caused by viral as well as bacterial or fungal infections or may result from autoimmune disorders. Autoimmune disorders which may be treated using autoimmune deforces, connective tissue disease, multiple sclerosis, systemic lupus erythematosus, rheumatoid arthritis, autoimmune pulmonary

Novel

polypeptides termed PTMAX, for detecting and treating

treating English.

Additionally PTMA may also be useful to promote better or faster closure of non-healing wounds, including pressure ulcers, ulcers associated with vascular insufficiency, surgical and traumatic wounds. Furthermore, PTMA may also be useful for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissue, and conditions resulting from systemic cytokine damage.

                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents human nerve growth factor (NGF). The protein cencoded by this sequence promotes the development of the peripheral nervous system and also influences the development and maintenance of specific populations of neurons in the central nervous system. Two major transcripts from the NGF gene result in a "long" and "short" NGF prepropeptide. The "short" precursor contains a conventional signal sequence at the N-terminus which flanks the pro-region. The "long" precursor contains an additional "pro-region" at its N-terminal. No functional distinction has been elucidated between the "long" and "short" forms. Characteristics of NGF, such as isoelectric point and primary structure, are very similar to barin derived neurotrophic construction of a chimeric nucleic acid molecule to encode a prepro-
